

Following is a mock for invoice generator which needs to be created as a web app. The app allows the user to do following:

1. Upload company logo (OPTIONAL)
2. Enter invoice number (OPTIONAL)
3. Enter address of sender and receiver. State should be a dropdown with at least 5-6 states if not all.
4. Invoice date and due date should be date pickers.(OPTIONAL)
5. Items table should be empty to start with. User can click Add item button to get an inline form within the table. Each of the rows can be edited.
6. Sub total is sum of all amounts. Tax can be entered by the user as a percent and Total should be sum of Sub Total and Tax calculated.
7. Total should be displayed as words. (OPTIONAL)

For the UI task, the basic elements should be working. Any UI library or package can be used. Feel free to consult Stack Overflow, Github etc, but do not copy any code as it is.

**Project Submission: Share the project on a github repo. If the project can be deployed on Netlify/Vercel or any other platform, that will be nice to have. If not, please provide the steps to run the code.**
